Education

Birla Institute of Technology and Sciences

Bachelor of Science in Computer Science

Aug. 2024 – Aug. 2027

Pilani, India

City Montessori School

Schooling

April 2009 – April 2024

Lucknow, India

Experience

Subatomic Forge Studios

Beta Tester

September 2025

- Worked with the studio to help improve the user experience of the game (The Space Between).
- Mentioned in the credits of the game.
- Reported gameplay bugs, usability concerns, and balancing feedback during active testing phases.

VeritusAI

Business Development Intern

November 2025 – January 2026

Osaka, Japan – Remote

- Worked on professor outreach and onboarding. Led cold messaging and email outreach campaigns targeting IIT professors and academic researchers.
- Identified and qualified potential users, personalized communication to explain product value, and followed up to drive onboarding and early adoption.

Projects

Griddle | Unity, C#, WebGL, Game Design

- A word puzzle game combining crossword structure with Wordle-style letter deduction, without traditional clues.
- Designed interconnected 5-letter word grids where solving one word reveals letters in crossing words.
- Implemented grid-wide structural hints, scoring, progression, daily puzzles, and endless mode.
- Built deterministic puzzle generation with automated solvability and difficulty validation.
- Designed and implemented 20 campaign levels with increasing difficulty and curated word pools.
- Deployed as a WebGL game and hosted on itch.io: [Link](#)

SphereRunner | Unity, C#, Game Design

- A 2D level-based runner focused on precision movement and obstacle timing.
- Implemented player movement and collision detection using Unity physics.
- Implemented collision-based level reset system and structured scene management.
- Designed patterned obstacle behavior to create increasing gameplay challenge.

FallingBlocks | Unity, C#, WebGL Deployment

- A 2D arcade survival game built to explore core Unity mechanics and scripting fundamentals.
- Implemented keyboard-based player movement, screen wrapping logic, and collision detection using Unity's physics system. Designed dynamic difficulty scaling using time-based progression and procedural obstacle spawning.
- Built event-driven Game Over system with UI handling and scene reloading.
- Deployed as a WebGL build and hosted via GitHub Pages.
- Playable Web Version: [Link](#)

PongPing | Unity, C#, WebGL Deployment, Game Jam Submission

- A reverse-pong inspired arcade game where the player controls the ball instead of paddles.
- Implemented increasing difficulty system using time-based scaling and procedural block spawning.
- Built core gameplay systems including player movement, collision detection, object pooling logic and UI game over flow.
- Deployed playable WebGL build for browser based access.
- Submitted to a competitive game jam and ranked #228 overall and #120 in Enjoyment among 523 entries, receiving 22 ratings against a median of 14 per submission.
- Deployed on Itch.io: [Link](#)

Technical Skills

Languages : Java, C#, Python, HTML/CSS, MySQL, Spring Boot, React

Game Engines : Unity | GDevelop | Unreal Engine

Developer Tools : Git, GitHub, VSCode, Canva, GitHub Pages, Itch.io
